

## Possible risk and complication

*Fat transfer of small amounts from one area to other parts of the body under local anesthesia is a very safe procedure, and more serious complications such as infection are rare.*

## Recovery time

*Patients can usually return to work within a few days to a week, although swelling may take longer to subside.*

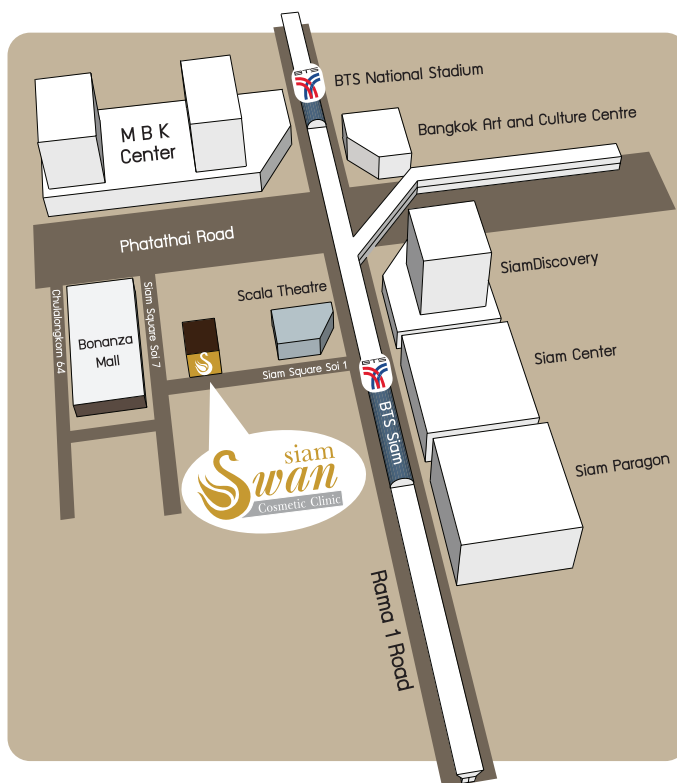

## Combination procedures

*You can do microfat injection together with other facial procedures like as eyelid, eye bag, and nose or facelift surgery.*

## Fat stem cell enhancement

*Adipose derived stem cell (ADSC) or fat stem cell is the upmost advancement of facial rejuvenation and body enhancement with autologous tissue. Please contact our doctor for more information.*

## LIPOFILL MICROFAT INJECTION

*Natural Facial Contouring*

Microfat transfer, also called autologous fat transplantation or micro-lipo injection, is the technique of moving fat from one area of the body to another to improve contour, correct defects, all enhance features. This procedure is a popular alternative to other wrinkle treatments. Fat transfer to the face is a safe, natural, non-allergenic procedure designed to recontour your face and can provide definition to your cheeks and chin.

## Surgical procedure

Fat is harvested through a small liposuction cannula (tube) from the abdomen or hips and carefully prepared for re-implantation by spinning the fat in a centrifuge to separate the cells from the fluid. The healthy fat cell is then injected with a blunt needle and syringe into the desired locations such as the cheeks, around the eyes, temporal areas, and jaw lines or around the mouth for lip augmentation. Incisions are typically

limited to small puncture wounds less than 1 mm in size. The amount of fat removed from the donor site is minimal compared to traditional liposuction surgery, and will not alter the appearance of that location. Microfat transfer tends to be more permanent when injected around the eyes, cheeks and temporal areas and less so when injected for lip augmentation or around the chin or mouth. Repeat treatments may be necessary.

## Advantage

Microfat injection is a quite good procedure for sunken cheeks, sunken temporal, hollow eyes, tear trough or dark circles eye and lip enhancement, including correction of previous surgical mistakes.

## Duration of operation

About one hour

## Anesthesia

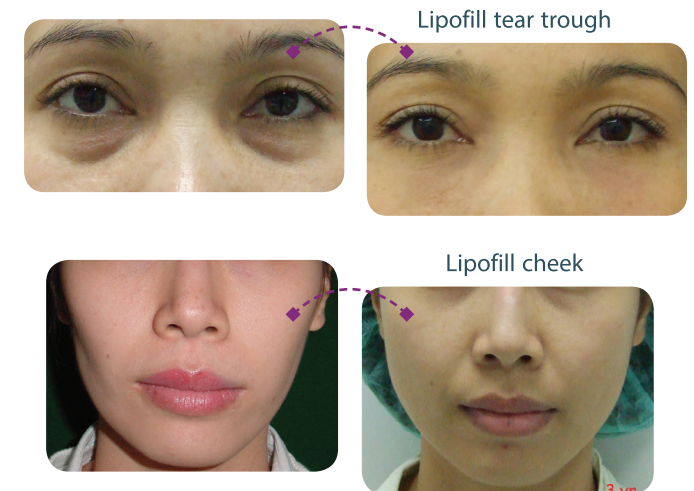

Local anesthesia with sedating medication

## Hospital admission

Microfat transfer is performed on an outpatient basis. You can go back in the same day.

## After care

Patients are up and around immediately following fat injections. Any discomfort following the procedure can be controlled with medication. Some swellings at the treatment site may last up to weeks. There may be some bruising, which can be covered with make-up. Your initial injection should last up to six months. Over the first few months about 10-40% of the fat will be possibly absorbed by your body. The remaining will usually stay in place for years. You can come back to retouch anytime.
